Research Perspective

“A single neural network predicts bounding boxes and class probabilities, directly from full images in one evaluation[1].”

Agenda:

- What Is a Recognition Model?
- Types Of Recognition Models
- MicroPython: A Mini Tools Primer
- Lab: Characteristic Learn Device

What Is a Recognition Model

- A Recognition Model is an artificial intelligence or machine learning model designed to
 - a) identify
 - b) classify or
 - c) verify objects
 - d) patterns
 - e) or signals in data.
- Unlike detection models (which just find and locate things), recognition models focus on understanding what those things are.

What Is a Recognition Model . .

A recognition model maps input data (such as an image, sound, or sensor signal) to a known category, label, or identity.

Mathematically: $f(x) \rightarrow y$

Where:

x = input data (image, voice sample, fingerprint, etc.)

f = recognition model

y = recognized label (e.g., "cat," "Alice's face," "digit 7")

What Is a Recognition Model . .

The probability of the image being recognized uses the following Softmax equation.

$$P(y = k|x) = \frac{e^{z_k}}{\sum_{j=1}^K e^{z_j}}$$

where:

- z_k = score (logit) for class k from the network
- K = number of classes

Softmax is a mathematical function used in neural networks to convert a vector of real numbers into a probability distribution.

What Is a Recognition Model. . .

A Python model can be used to illustrate the recognition model aided by the Softmax equation.

```
Classes = x =[ apple, banana, grape, orange]
```

The Python model will determine that the image is a “grape” based on the Softmax equation’s probability score.

Question 1

For a recognition model, what types are used?

- a) image, voice sample, fingerprints**
- b) voice sample, keyboard, mouse**
- c) tablet, image, voice sample**
- d) none of the above**

What Is a Recognition Model...

Classes

Simulated
scores

Softmax Eq.

```
1 import numpy as np
2 import matplotlib.pyplot as plt
3
4 # --- Step 1: Define fruit classes ---
5 classes = ["apple", "banana", "grape", "orange"]
6
7 # The target image is a grape
8 true_label = "grape"
9
10 # --- Step 2: Create simulated logits (scores) for each fruit ---
11 # Higher score for grape to simulate recognition
12 z = np.array([1.2, 0.8, 2.5, 1.0]) # raw model scores (logits)
13
14 # --- Step 3: Apply Softmax to get probabilities ---
15 def softmax(z):
16     exp_z = np.exp(z - np.max(z)) # stability trick
17     return exp_z / np.sum(exp_z)
18
19 probs = softmax(z)
20
```

Python
Partial code

What Is a Recognition Model...

⇒ Class Probabilities ($P(y=k|x)$):

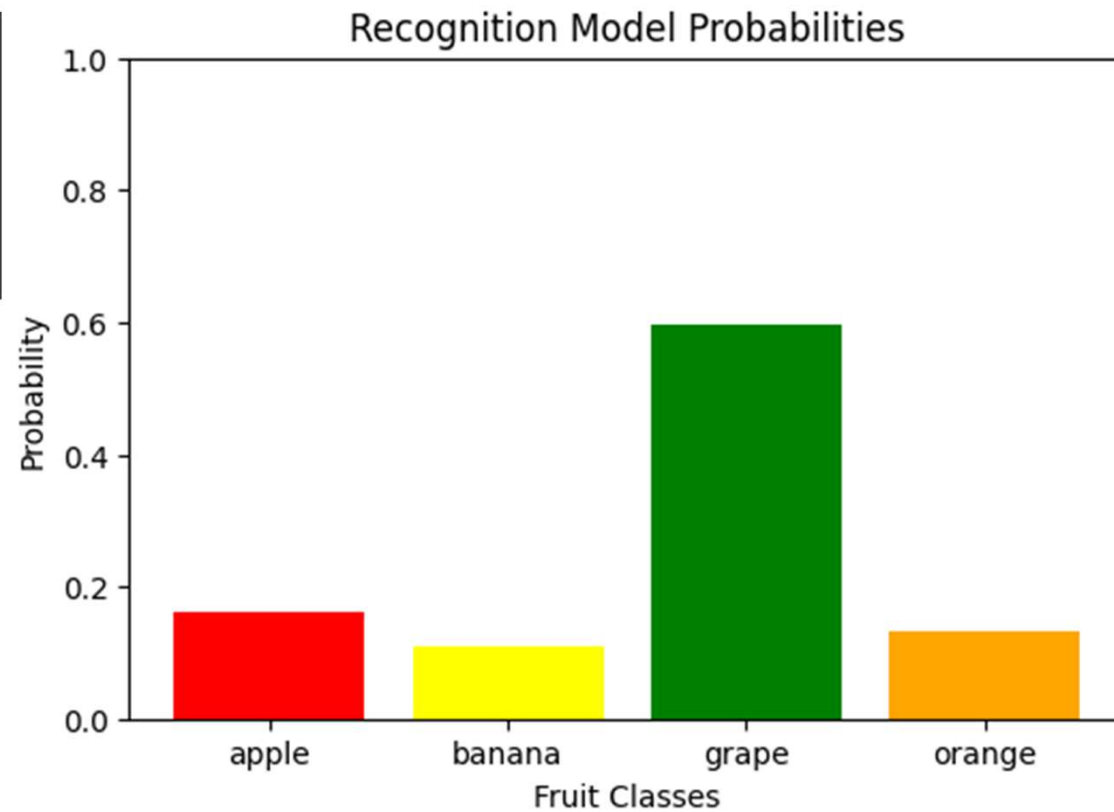

apple: 0.162

banana: 0.109

grape: 0.596

orange: 0.133

Predicted Class (\hat{y}): grape

What Is a Recognition Model. . .

Why are Recognition Models important?

Recognition models are important because they give machines the ability:

a) to *know what something is*, not just that it exists.

b) They provide

i. classification

ii. identity, and meaning,

c) These elements are critical for security, automation, personalization, and human-like interaction.

Types of Recognition Models

1. Image Recognition Models

- What they do: Identify and classify objects, scenes, or patterns within images.
- Examples:
 - a) Recognizing whether an image contains a cat, dog, or car.
 - b) Identifying a tumor in a medical scan.
- Mathematical core: Softmax-based classifiers over extracted features:

$$\hat{y} = \arg \max_k P(y = k | x)$$

- Algorithms/architectures: Convolutional Neural Networks (CNNs), Vision Transformers (ViT).

Types of Recognition Models. . .

2. Object/Face Recognition Models

- What they do: Detect and identify specific instances of objects or people.
- Examples:
 - a) Face ID unlocking a smartphone (recognizes *you*).
 - b) Recognizing a product by its brand logo.
- Two parts:
 - Feature extraction (embeddings from CNNs/ViT).
 - Similarity measure (cosine similarity, Euclidean distance).
- Mathematics:

$$\text{similarity}(f(x_1), f(x_2)) > \text{threshold} \Rightarrow \text{same identity}$$

Types of Recognition Models...

3. Speech Recognition Models

- What they do: Convert spoken language into text.
- Examples:
 - a) Voice assistants (Alexa, Siri, Google Assistant).
 - b) Automated transcription.
- Pipeline:
 - a) Audio waveform → feature extraction (MFCCs, spectrograms).
 - b) Sequence model (RNN, Transformer).
 - c) Probability distribution over vocabulary words.
- Mathematics (sequence recognition):

$$\hat{y} = \arg \max_y^* P(y | x_{1:T})$$

where $x_{1:T}$ is the audio sequence.

Types of Recognition Models. . .

4. Text Recognition Models (OCR)

- What they do: Recognize printed or handwritten characters from images.(Associated with Modified National Institute of Standards and Technology (MNIST).

- Examples:

- a) License plate recognition.

- b) Reading handwritten digits (MNIST).

- Pipeline:

- a) Image → segmentation → character recognition.

- b) Often CNN + RNN + CTC loss for sequence alignment.

Question 2

Which equation is true for a Softmax-based classifier?

a) $\hat{y} = \arg \max_k P(y = k | x)$

b) $\hat{y} = \arg \max_k P(z = k | x)$

c) $y = \arg \max_k P(y = k | x)$

d) none of the above

Types of Recognition Models. . .

Other Types of Recognition Models include:

- Pattern/Character Recognition – Reads structured data like handwriting or license plates.

Example: OCR (Optical Character Recognition).

- Speech Recognition – Converts spoken words into text.

Example: Siri or Alexa understanding a command.

- Biometric Recognition – Identifies humans by unique features (iris, fingerprints, gait).

Example: Border control systems verifying passports.

MicroPython: A Mini Tools Primer

Micro:bit.org Editor

<https://python.microbit.org/v/3>

BBC Micro:bit
Development
Tools (Nordic
Semiconductor
nRF SoC)

The screenshot displays the MicroPython editor interface. On the left is a sidebar with a search bar and several project options: Sound, Microphone V2, Touch logo V2, Data logging V2, Pins, and NeoPixels. The central area is a code editor titled 'Untitled project' containing the following code:

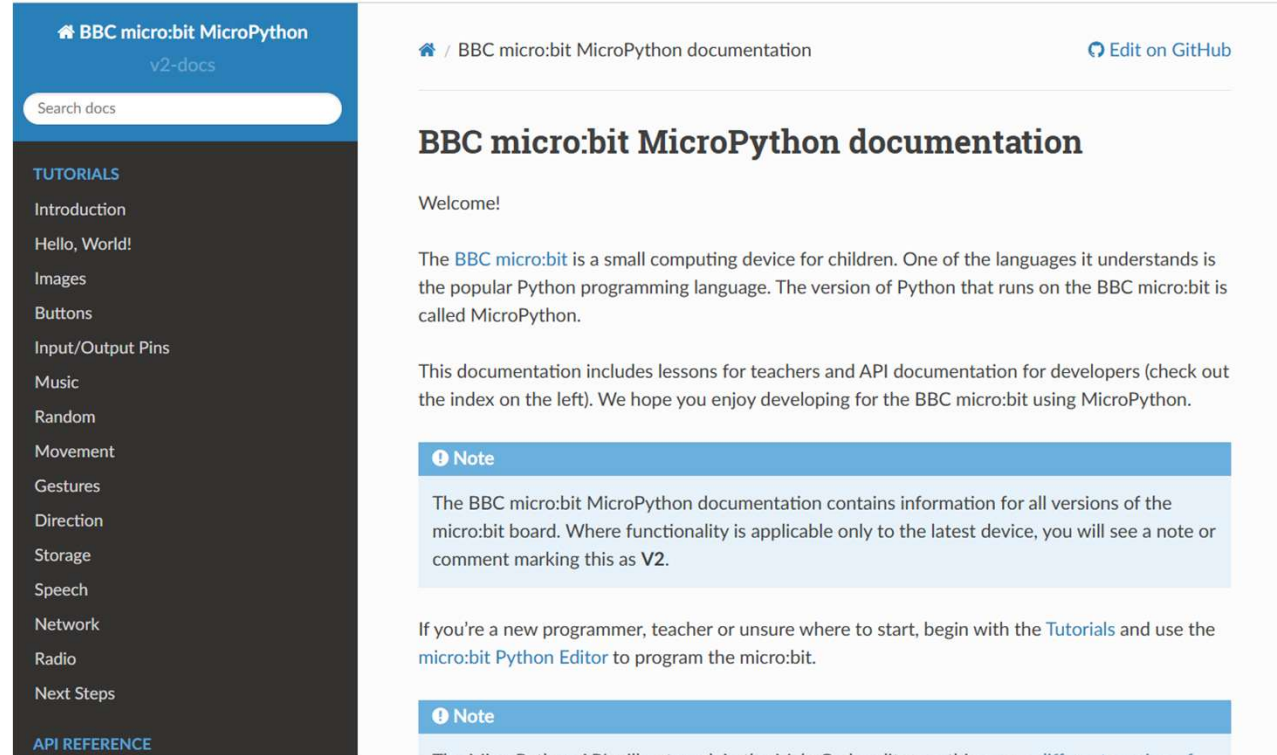

```
1 # Imports go at the top
2 from microbit import *
3
4
5 # Code in a 'while True:' loop repeats forever
6 while True:
7     display.show(Image.HEART)
8     sleep(1000)
9     display.scroll('Hello')
10
```

At the bottom of the code editor are buttons for 'Send to micro:bit', 'Save', and 'Open...'. On the right is a virtual representation of the micro:bit board with a yellow logo and red LEDs. Below the board is a 'Show serial' dropdown menu and a 'shake' button with a play icon. At the very bottom, there are several control buttons labeled 'A', 'B', and '0', '1', '2'.

BBC micro:bit MicroPython documentation

Welcome!

The **BBC micro:bit** is a small computing device for children. One of the languages it understands is the popular Python programming language. The version of Python that runs on the BBC micro:bit is called MicroPython.

This documentation includes lessons for teachers and API documentation for developers (check out the index on the left). We hope you enjoy developing for the BBC micro:bit using MicroPython.

Note

The BBC micro:bit MicroPython documentation contains information for all versions of the micro:bit board. Where functionality is applicable only to the latest device, you will see a note or comment marking this as **V2**.

If you're a new programmer, teacher or unsure where to start, begin with the [Tutorials](#) and use the [micro:bit Python Editor](#) to program the micro:bit.

Note

The MicroPython API will be updated in the MakeCode editor as this uses a different version of

MicroPython: A Mini Tools Primer

Microsoft MakeCode's version of MicroPython

```
1 # PlanetX AI Lens - Characteristic Learn (MakeCode Python)
2 # - Add extension: elecfreake / pxt-PlanetX-AI
3 # - Connect AI Lens to I2C (SCL/SDA) per your breakout board
4
5 # initialize and switch to feature/thing (characteristic) learn mode
6 PlanetX_AILens.init_module()
7 PlanetX_AILens.switchfunc(PlanetX_AILens.FuncList.THINGS)
8
9 basic.show_icon(IconNames.ASLEEP)
10
11 # Button A: capture / learn current object into learned-slot ID1
12 def on_button_a():
13     # learn into slot ID1
14     PlanetX_AILens.learn_object(PlanetX_AILens.learnID.ID1)
15     basic.show_icon(IconNames.HEART)
16     basic.pause(1500)
17     basic.show_icon(IconNames.ASLEEP)
18 input.on_button_pressed(Button.A, on_button_a)
19
20 # Button B: optional quick visual check of confidence (press to display confidence)
21 def on_button_b():
22     # query confidence (0..100 maybe) for learned ID1
23     conf = PlanetX_AILens.object_confidence(PlanetX_AILens.learnID.ID1)
24     # object_confidence returns a numeric confidence value (some builds return 0 if none)
25     # show approximate as a number (may be >9 so show as two-digit)
```

BBC Micro:bit
Development
Tools (Nordic
Semiconductor
nRF SoC)

Question 3

In reviewing slide 25, which API “Get the info of the cards from the AILens to a list?”

- a) switch_function(func)**
- b) get_card_content()**
- c) get_card_data()**
- d) none of the above**

Lab: Characteristics Learn Device

Lab: Characteristics Learn Device. . .

Participant Learning Objectives:

- Participants will learn how to use the Microsoft MakeCode Python to build the Characteristics Learn Device.
- Participants will learn to implement a learning event on recognizing an object using the Smart AI-Lens to Micro:bit Sensor Shield.
- Participants will learn to view the Confidence Level on the Characteristic Learn Device.

Characteristic Learn Device Demonstrator Electrical Wiring Diagram

Smart AI-Lens
powered ON

Smart AI-Lens
wired to the
Micro:bit
Sensor Shield

Lab: Characteristics Learn Device...

User Interface (UI) of Characteristic Learn Device

Operation:

A press/release on Button A, will allow the Smart-AI Lens to capture and store an object's image. Placing the object in front of the Smart-AI Lens will allow the micro:bit to display a Smiley face. No object present or the incorrect object will display a Sad face on the micro:bit's 5x5 LED matrix.

Lab: Characteristics Learn Device...

Setup Procedure

1. Go to Microsoft MakeCode: micro:bit and open a new project.
2. Click on the Python button to open a new editor.
3. Copy and paste the Characteristics Learn Python code from the text file into the editor.
4. Add the PlanetX-AI extension in the Make Code Python project before compiling. Note: The extension provides the PlanetX-AI Lens API to the programming environment.
5. Attach the micro:bit to the code development laptop computer or desktop PC USB port.
6. Download the Characteristics Learn code to the micro:bit (Click the Download button)
7. Insert the micro:bit into the Sensor Shield. Attach the USB cable to the Sensor Shield's USB connector.

Lab: Characteristics Learn Device...

Learn Mode

1. Place an object in front of the Smart AI-Lens.
2. Press/release Button A. A **heart** will be displayed on the micro:bit's 5x5 LED display.
Note: the object is stored as an image on the micro:bit.
3. Press Button B. The number 79 will scroll on the LED matrix. This number is the confidence level..
4. Place the learned object from Step 1 in front of the Smart AI-Lens.
5. A **smiley face** will be displayed on the micro:bit's LED matrix.

Lab: Characteristics Learn Device...

Characteristics Learn Python Code pasted onto the editor

```
1 # PlanetX AI Lens - Characteristic Learn (MakeCode Python)
